Business Requirement

Application developers of your organization are going to create an application using Java. However, they are finding it difficult to link MongoDB database to their application. Now, you are responsible for connecting the application to the database.

Key Issues

- You must have basic knowledge of Java coding
- You must know how to configure Java drivers in your system

Approach to Solve

- Install the drivers of Java compatible with the current version of MongoDB and install it
- Create a new collection and insert a MongoDB document using Eclipse
- Observe the changes in MongoDB
